FF-106 SERIES

double nozzle flapper force feedback flow control EHSV
AVIC Nanjing Servo Control Systems Co., Ltd has been manufacturing servo valves for over 50 years. FF-106 series servo valves have been widely used in both military and industrial applications, such as aviation, aerospace, radar, metallurgy, chemical industry, manufacture, geological exploration, construction, power generation, textiles, printing, and various kinds of test equipment. Now we can deliver over 10000 pieces annually. FF-106 is an affordable equivalent to Moog 35. It boasts a large share of domestic market and enjoys great reputation among users both at home and abroad.

Servo valves in this catalog are in conformity with GJB3370-1998 of China military standard for servo valves used for aviation.

Our quality management system has passed ISO 9001:2000 quality assurance standard.

Note
Please clear the whole hydraulic system before installing servo valve as per ISO 6072.
Please refer to general technical data and electrical performance.

This catalog is for users with professional knowledge. Please refer to this catalog to ensure the safety and every function of system. We reserve the right to change the specifications in this catalog before notice. Please contact AVIC Nanjing Servo Control Systems Co., Ltd in case of any enquiry.

609 F is the trademark of former China Research Institute of Aero-Accessories (NO 609 Research Institute). AVIC Nanjing Servo Control Systems Co., Ltd is a restructuring unit of 609; reserves the right to ownership, change.

Characteristics

- High precision control, fast dynamic response and ease of operation.
- Stainless steel body/high structure strength.
- Compact structure, small size and light weight.
- Stable performance, high reliability and long working life.
- Low internal leakage and low power consumption.
- Low hysteresis, high threshold and high repeatability precision.
- Excellent linearity, driving force and small null shift.

Structure

Serve valve consists of permanent magnetic torque motor first stage hydraulic amplifier and power amplifier.

Permanent magnetic torque motor consists of armature assembly (1), upper pole piece (2), permanent magnet (3) left and right coils (4), flaxure tube (5), lower pole piece (6), 2 nozzles (7) fixed orifices (10) and internal oil filter (11). The armature assembly (1) is made up of armature, flaxure tube, flapper and feedback spring.

They are connected by soldering and crimping. The armature assembly is fixed on the valve body (12) by 2 bolts. Power stage amplifier is made up of sleeve (8) and spool (9) and other parts.

Operation

FF-106 EHSV has a polarized torque motor, which consists of 2 permanent magnets, armature assembly, upper and lower pole piece and 2 coils in the torque motor. Two pieces of charged permanent magnets polarize polepieces, and both ends of its armature are respectively inserted into the gaps formed by upper and lower pole pieces. A flaxure tube is employed to play the role not only in a spring support for the armature-flapper assembly but also in a sealing between electromagnetic and hydraulic parts. The flapper of the first stage hydraulic amplifier is inserted between two nozzles, forming two variable orifices. A feedback spring extends from flapper inner and inserts its ball end in the small slot of the spool.

When electrical current input is applied to the torque motor coils, due to the interaction between controlling permanent flux, a magnetic torque is created on the armature. This torque makes the armature-flapper assembly rotate about the flaxure tube support, moving the flapper in one direction or in another direction. The moved flapper results in increasing the area of one flapper-nozzle orifice and decreasing the area of the other one, creating differential pressure in the two nozzle controlled chambers. This differential pressure moves the spool, pushing the ball end of feedback spring and creating restoring torque on the armature-flapper assembly. The spool goes on moving until the feedback torque becomes equal to the magnetic torque caused by control current input. At that time, the flapper is moved back to a nearly neutral position. As the magnetic torque is proportional to the current input. And the feedback torque is proportional to the spool position as well. Therefore, the spool position is proportional to the input current while the mentioned torques are being balanced. Then, with constant valve pressure drop, valve flow output to load is proportional to current input when rectangular holes (slots) or annular grooves are employed in the valve bushing.

Performance

Working pressure: Rated supply pressure: 21MPa Return pressure: ≤0.5MPa
Temperature and humidity: Ambient temperature: -55°C ~ +150°C Fluid temperature: -30°C ~ +100°C
Relative humidity: 10% ~ 90%

Seal material: NBR, FPM (other materials at request)

Working fluid: Petrol based hydraulic fluid per DIN 51524 or hydraulic fluid viscosities 10 ~ 400mm²/s at 38°C as per clients.

Filter rating: ≤0.015μm, recommend ≤0.015μm

Installation: It can be installed in any position or move with system.

Vibration: 3g—5g (3 axis), 5Hz—2kHz

Weight: ≤1.2 kg

Protection plate: Included in standard delivery

Flow Calculation

Valve actual flow will be decided by spool position and pressure drop between valve supply and return chambers. Under rated pressure drop 213bar (3000psi) and 100% command signal when valve spool moves further, valve no-load rated is defined as rated flow rate Qn.

At non-rated pressure drop and given commander signal, valve no load flow is proportional to square root of valve supply and return chamber.

Qn = √ΔP

Where:

ΔP = valve actual pressure drop (MPa)
Qn = valve actual flow rate (l/min)

When the average flow rate is 0.1l/min, valve volume flow Q can be calculated using this method.

Flow Diagram

At 100% command signal, valve actual flow rate is linear with valve pressure drop.

Note: 70bar—101bar. The curve demonstrates actual flow rate at different pressure drop. Users can pick up EHSV accordingly as per system supply pressure.
Hydraulic symbol

This symbol is for EHSV status with supply pressure and command signal at 0.

Electrical connection:

Coil connection mode:
- Individual coils: 2+, 1- or 4+, 3-
- Series coils: connecting 3 with 4; 2-3-
- Parallel coils: connecting both 1 with 3 and 2 with 4; (1,3) - (2,4) +

Polarity regulation:
- If the current flows from 2+ to 1-, traffic outputs from window 1
- If the current flows from 1+ to 2-, traffic outputs from window 2

**Spare parts and accessories**

- O-ring (included in standard delivery)
  - NBR: 75 Shore
  - FPM: 75 Shore
- for part P, R, 1, 2: 4 pieces, ID12×OD22
- Mating connector
  - It is available in XE1142/3 and XE1142/3/IX1142.
- Installation bolt (included in standard delivery)
  - M6×4 ISO 4762-10.9: 4 pieces
- Replaceable filter
  - for pilot stage, installed before orifice: β50=75 (corresponding to filtration 15μm absolute)

AVIC Nanjing Servo Control System Co., Ltd., a subsidiary of Nanjing Engineering Institute Of Aircraft System( former AVIC 605 Research Institute), is the national leader in the research and development, manufacture of electro-hydraulic servo valves(EHSV in short), with the longest history(since 1948), the largest size and the most advanced level in China. AVIC also has invested in the company. Our company is mainly engaged in the research and development, manufacture, test and delivery and repairs of EHSV and also has the ability to develop servo systems and non-standard equipment for industrial applications.

We have a staff of over 200 people with 29 of them being engineers or senior engineers and 51 being senior technicians. Our factory covers an area of 30,000 m² and our lab covers an area of 4000 m². We have over 300 sets of equipment and machines, with fixed assets valued at USD 25 million. We are the only one in China to carry out performance test and environment test and validation with working fluid of mineral based hydraulic fuel, phosphate fuel and fuel.

Our EHSV are widely used in aeronautics, space, navigation, metallurgy, machine manufacture, geological exploration, construction machines and all kinds of test equipment. In aeronautics applications, EHSV are used in rubber actuation system, front wheel control system, inlet control system, electronic anti-skid system, radar servo system, cargo door retraction system, engine digital control system, APUs and APU.

Our product line covers over 200 models, including force-feedback single stage servo valve, nozzles, flapper valve, two stage servo valve, jet pipe EHSV (jet pipe and jet deflector type), LDOV and RDOV, combined control valve, electro-magnetic hydraulic lock, pressure-reducing valve, hydraulic pump, servo amplifier and EHSV static and dynamic test bench. EHSV’s working fluid covers mineral based hydraulic fuel, phosphate fuel and fuel.

We are also the national leader in terms of EHSV performance test and environment test and validation using hydraulic fluid and fuel. Our test bench includes static and dynamic test, high and low temperature, vibration and shock, temperature-altitude environment test. Temperature test bench can go as far as fluid temperature: -55°C ~ +150°C, environment temperature: -55°C ~ +250°C.

For example part NO.063217P15 means rated flow 633l/min, rated supply pressure 21MPa, standard connector is at the side of port p, rated current 15 mA.

Custom design is also available in terms of rated flow, rated current, coil resistance, rated supply pressure, envelope and connector.

For standard EHSV, standard connector is used and installation direction is at the side of control port 2.

Now we are setting 2 national military standards and one industrial standard. We have 28 technical patents covering EHSV design, measurement and process and test method for whole valve and parts. We also have state of art equipment for hydraulic grinding, deburring etc.
